[fresh](#)

Lid for your metal cans, keeps it fresh and pests can't get in to your drink. Works with 0,25 - 0,5L cans. Print it 0.2 layer height, 2-3 walls and ~40 infill.

No supports required.

Tried PLA and PETG - Both works like a charm.

Added file for tighter tolerances - this made svivel and cap tighter - use this with only really dialed in printers - this file may still require some "break in" to be done, few open and closes should be enough.

Model files

can_lid_jl.stl

can_lid_jl_tighter_tolerance.stl

☐ For dialed in printers - tighter tolerances for lid and svivel
