Summary

Wall support for sonos era 100 speaker

[Household](#) > [Living Room](#)

Wall support for Sonos Era 100 speaker.

The speaker orientation will be perpendicular to the wall (it's not exactly round, so you can not rotate it). It requires 3 screws in the wall (check images for hole-distances) plus one M5 screw for the speaker itself. There is space for the wire either through the wall (if you have this possibility) or to the bottom.

The must have supports are for the middle part. In my screenshot from prusaslicer you will see that I kept supports also for the empty "circles" , but i think this is optional. I used PETG and variable layer height to be smoother on the front (or on the top, in the printing position).

The result looks very solid, I don't have concerns regarding the stability.
