I really like the model "Apple iPhone & Watch Stand for Wireless Charging (MagSafe)" by Daniel @Daniel_130434 (<https://www.printables.com/model/70145-apple-iphone-watch-stand-for-wireless-charging-mag>).

In the description for that model, Daniel mentions using tape to hold the stand down because of the light weight. I decided I wanted a way to have a substantial weight and no tape on nice furniture. I created this model to easier hold a substantial amount of weight.

I copied the corners of the bottom layer of Daniel's model for the overall shape of mine and created a small hollow stand. I decided to square off the back side to make it larger for holding heavy materials. I made an expanded opening on each side for ease of routing cables but also to make it easy to stick a screwdriver into the slot to break the two prints apart if you want to remove the chargers or weights.

Once you fill the base with weights (fishing weights, BBs, steel shot, or any tungsten shavings you have laying around the house), you can then glue it to the bottom of Daniel's excellent charging stand for iPhone and Apple Watch and it should stay put nicely.

This model should print and fit precisely to the bottom of Daniel's stand. The two versions only differ in height - one is 15mm tall and the other is 20mm tall.

All photos show the 15mm version printed with Prusament Jet Black PLA sliced at 0.20mm layer height in Quality mode on a Prusa MK3S with 0.40mm nozzle.
