Summary

The epic Ender Dragon from the videogame Minecraft - as Mini 13 mod and as fully articulated action figure...

I was searching for a good and easy to print model of the epic Minecraft ENDER DRAGON. I've found and printed some models, but nothing good to play with.

So I build a new ender dragon model from scratch and used the amazing ball-joints from the [Mini 13 figure](#). So its fully articulated, you can set it up in every pose. The joints (PETG recommended) are tight and hold the position. Also you can use other [Mini 13 remixes](#) on it. Feel free to print the more of the parts to have longer tail, neck or bigger wingspan... ^_^

I highly recommend to print it in a 150% scale of the original Mini 13 size for better durability and playing (a separate stl-file is available)!!

UPDATE: I've added a new body in 150% with space for including (glue needed) a LEGO 2x2 plate. So a LEGO Minecraft rider can take a seat! Wohaaaa. And also an instruction picture.

And now: Have fun printing!

PS: I've printed it complete in black and painted the white stripes with an edding pencil.

My print settings (100%): _____

material: PETG recommended (50 g), PLA could work too

infill: 10 %

rims: no

walls: 3 recommended

supports: only the part "Body" needs support

printing time: 2 h

This remix is based on
