No more toothpicks and refilling the water every day! With this floating grower, the avocado seed will stay submerged evenly for weeks! As the water evaporates, the floater will simply go down with the water level.

Once the avocado is grown and ready to be planted in soil, simply remove the two clips and split the grower in half. You'll free to avocado and can re-use the print for your next seed.

The g-code with clips includes 6 of them because they are tiny and print really fast. Otherwise, the printer would have to slow down anyway to let the layers cool down.

Print instructions

The boat needs to be watertight, so if you choose to re-slice the model yourself, I suggest to pick a material with similarly good bonding as PETG.
