I redesigned from scratch my favourite silica container by Malolo.

I loved absolutely everything about it, except that it prints a little slow. I used horizontal slots so that it prints much faster with less retractions and hops. In 0,3mm layer height, it saves around an hour of print time and a couple grams of filament. (1,5 hours versus 2,5)

It is also my first time using [dans98's custom Fusion 360 threads for FDM printing](#), which gives nice presets for thread angles that suit FDM printing and easy to understand clearances. I recommend checking it out!

I made only the 50x50 as it is the one I use the most, but various sizes would be easy to adjust.

Print instructions

- No supports
- Print cap upside down
- 0,3mm layers work well
- Detect bridging perimeters
