We have a small empty space next to our kitchen cabinet which is covert with a front plate.

To get the HomePod mini out of the way, I tinkered around to use the empty space and its features as a mounting point.

The model is splitted in parts:

**green parts:** the basic mount for the edge of our free space in the cabinet

**black part:** extender to block any movement

**blue part:** kind of printed splint to fix the two green parts together while leaving space for the cable

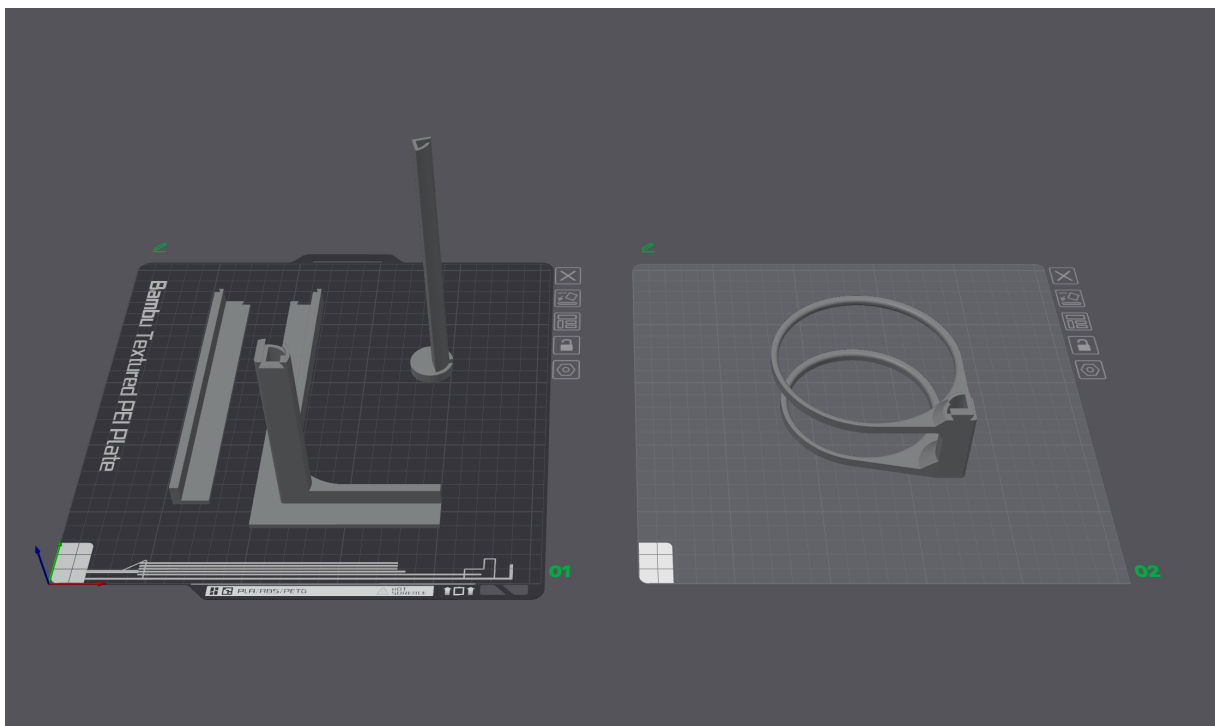

### How to assemble it:

Stick the two green parts together and insert the HomePod mini cable

insert the cable also into the splint (blue part)

insert the splint into the green part to stabilize and fix it

Printing with 6 walls and tree support for plate 02
