Summary

A simple mount/holder to attach a BMW electric car charger to the wall.

This is a simple holder to be able to mount a BMW electric car charger to the wall. My car is an i4 M50 but I suspect the charger is the same for all current/recent models. There is a lot of room here so probably many other chargers could fit too. It is not at all tight for the BMW charger. Similarly the bottom opening for the cable is very large and there is ample space for something larger there.

Screw holes are 6mm with a 12mm wide and 5mm deep recess for the screw head.

I printed this on an Elegoo Neptune 4 pro with the Elegoo PLA pro filament because that's what I happened to have.

I used supports which the slicer said were needed and the end result was fine. Probably you'd use PETG or something better in an ideal situation especially if the mount would be in direct sunlight getting a lot of UV or in extreme temperatures.
