This is a minimalistic and effective gutter hook. I did not find any other model that fitted quite right, were using hours to print, or could be tuned, so I quickly made one in OpenSCAD.

The ones shown on the picture are printed using Extruder PETG. They have width and diameter of 2mm and are very sturdy for the purpose. If you don't use PETG, you might want to tune the thickness a bit.

As always with my models - the source file is in the downloads.
