Summary

A little extension to reposition the filament tube a bit away from the wall of the printer.

The filament spool location behind the printer works fine for me, but I didn't like the filament tube being held so tightly to the back of the printer (difficult when pushing filament into the tube). So I made this little extension that fits over the existing 'knob' to position the tube a bit farther away.

Printed in PLA with tree supports (on bed only).

Update: Turned the tube to be perpendicular to the way it slides onto the original guide, making it less prone to releasing while manually pushing filament up to the extruder.
