This is an interlocking barrel bead necklace or braclet. I printed it up as a braclet, but if you print up enough beads you could use it as a necklace instead. Probably best to print it both ways so that your neck and arm jewelry match.

I printed using a dual color PLA. I think it would look best using a dual or tri colored PLA. The model has the male and female ends, which screw together, and one main bead. The beads are approximately 10mm long. Print up many main beads so you have enough.

I think I used 20% infill. That should be plenty. I used automatic tree supports. That worked out real well and came off easy enough.

I used TPU filament as the “string” to put the beads on, but you could use sewing thread, yarn, some other type of string. Just tie a knot in the ends real tight. I used a drop of super glue to keep the knot from coming undone.
