Do you have a old Volvo S/V40 S60 or V70 key where the key grip has become sticky & not so nice!?

Here is a Key cover that i created to get rid of the tacky and discussing rubber like material on these keys.

I think this keys are from somewhere around the 99-04 year models.

You will have to get rid of the rubbery part of the key.

-Use a polygrip or similar pliers whit god grippy jaws to pinch the rubbery stuf of the "hard" inner section of the key.

-Knife is also possible to use to notch your way in to the core. (be careful :)

Once the hard inner section is free you will have to sand the flat sides a little to get the key flat and slim enough to be able to fit inside the cover.

I have made the cover as thin and thigh as i possibly could without having to modd the key to much.

Once the key fits in both the halves, place it in there and push the two halves together.

It's an interference fit.

I have not glued my keys in so far and I have been using one of the keys daily for a couple of months now without any issues.

Print Settings

Anycubic

- Printer:

Anycubic i3 Mega

- Rafts:

No

- Resolution:

0.15 to 0.30

- Infill:

Solid on the KeyCover and around 15% on the KeyRings

- Filament brand:

AddNorth

- Filament material:

X-PLA and PETG

- Notes:

Use support for the little key-ring "ring" on the Key Rings
100% infill on the Key Case
