I hated all currently available designs for an ebb42 toolboard mount on EVA3 that uses CPAP cooling with an Orbiter 2.0. I didn't want to put a big piece of plastic on the back of the motor cause of cooling concerns. Having it off the right makes troubleshooting a breeze too. Thanks to ratrig for the ebb42 mount body. I modified it for this use case obviously.

I didn't use any supports but i did boolean a rectangle under one of the screw holes you can snip it off after if you want.

m3 heat set inserts are required everywhere there's a circular pocket.
