Printable base and back plates to reconfigure your VKB STECS. Including Mini, Mini+, Standard, and Max compatible baseplates as well as a backplate for the STEM module. Want to reconfigure your STECS throttle but don't want to pay an arm and a leg in shipping from China? Got you covered.

I made a split version of the Standard plate for compatibility with smaller print beds. If there's enough interest I'll make an MFH but IMHO it's not [a great way to mount the STEM](#).

Print oriented as shown. A brim is suggested to prevent warping. Print with >5 perimeters and >40% infill for strength. No supports are required.

Note, STEM back plates require M3 hardware. (either nut or heatset insert)
