Summary

The simple and quickly printed solution with troughs for a secure hold of two plates, but more can fit on it!

I designed this under-table build plate holder for the build plates of the bambu and other printers.

I added two recesses so that two plates have a secure hold, but more than two can certainly fit on the holder (note the maximum weight depending on the material).

Please make sure to print in PETG or other stable materials with 100% filling, as the panels have a certain weight and PLA could be too brittle for this.
