### Summary

The OG-Nozzle from the good old days, before Bambulab, Supervulkanos and all the others took over

I recently found a picture of my first 3D printer and got hit by nostalgia. So I decided to model this little and therefore robust keychain, resembling the good old MK6 Nozzle, that was fitted on most of the cheap, old i3 style printers.

It didn't go easy on me... many clogs due to low filament quality at that time, molten material squeezing out besides the thread because the heaterblock came loose... I'm sure you know it.

Another bonus of the MK6 Nozzle is, that it can be printed completely without supports, since it doesn't have any sharp overhangs.

I printed it in silver because it reminds me of the "premium" hardened steel nozzles I paid way too much money for, but using gold filament you should be able to get the iconic brass look we all know and love.

I hope you like the design and it brings back some memory for some of you and I'd love to see your makes.

Happy printing!
