This model is designed to be mounted using the shorter POM wheel spacers that are included with the Sprite SE extruder. They are designed to be a snug fit around the spacer to provide a little extra rigidity in the assembly.

You'll need to cut a custom length of bowden tube to use between the extruder and hot end. I don't remember the length, my apologies for that.

I used PETG and Cubic infill, 60%

Simple installation, just follow my youtube video:
