### Summary

Small cup that clips into the cupholder to prevent drips from landing on the hot plate

[Household](#) > [Kitchen](#)

I was looking for a solution to drips onto the hot plate of our Ninja Dualbrew coffee maker, and after seeing <https://www.printables.com/model/490180-drip-catcher-for-ninja-dualbrew-coffee-maker> I was inspired to make a version which is always present on the machine. Hopefully this helps anyone else who hates cleaning dried on / burned on coffee residue.

Will catch drips automatically when brewing with the mug holder open, otherwise flip down the mug holder after brewing to catch drips. Raised lip on the front edge keeps drips inside when mug holder is raised up. Holds about 1oz of water/coffee, so will not prevent overflow if you start brewing without a cup in place

Two angled feet support the cup near the machine, so slide those in first, then press up so the center post clips over the edge to provide tension and secure it in place. Works fine for me in PLA, but will most likely break over time and I plan to re-make in PETG for better flex on the supports

Designed in Fusion 360
