Summary

I needed a "wide angele lens" on my C270 to see the whole build plate in my Kingroon KLP1 using my custom 40mm riser.

When using the C270 in my Kingroon KLP1, I wasn't able to see very much of the build plate because of the C270's small FOV. I grabbed the cheapest "Smartphone Wide Angle Lens"-Kit on Amazon and made it fit onto my C270 using the Remixed Version by **Daniel Vitanza**, which is a improved version of the [Logitech c270 webcam manual focus adjust ring. Thin & minimalistic.](#) by [Night_Gryphon](#) - Thingiverse.

The cheap Lens-Kit I used*: <https://amzn.to/3SkRHAb> (I still have the fish-eye-lens left for my phone 😊)

Screw in the Macro- and 0.67x Wide-Lens (they need to be used both to work correctly) into the printed Cover. The hole has a slight chamfer to make this task easier.

Then take the camera apart: Simply pull off the original decorative cover and take out the 3 screws (keep them!). Take off the unscrewed original cover and put on the printed cover... carefully tighten the 3 screws (you can turn each screw counterclockwise until you feel the screw jump into its thread in the plastic part before fastening the screw - that way you dont destroy the thread so fast).

Now lets see if you can see all you wanna see 😊
