There are some great tools available for RC car racers. This is a variation of a tool available, but this one is much more affordable.

This tool is used for clamping shafts and shocks without causing any damage, as well as assembly and disassembly of pivot balls/ball joints. I have reduced the width to 9mm to suit the shock assembly of 10th scale cars.

M3 taper head and button head screws required for assembly.

Note that I have forced the infill to 100% around the hinge and the front section of the tool during slicing.
