Tags: [cable](#) [2020](#) [cablemanagement](#) [keybak](#) [minibak](#)

The Ender 3 v2 has a very long hotend cable loom which tends to dangle and drag on the bed. The badge holder slides into the mount and the badge loop goes around the cable loom.

The original version slides into the channel of the 2020 extrusion. Works fine generally, except that it moves around.

The second version mounts to the 2020 extrusion using an M5x8 screw and a t-nut.

Print standing up with the “hook” facing up.
