## Summary

Holds drumsticks together

I got tired of using rubber bands to keep my sticks together in a bag or transporting them, so here we are.

I printed these in PLA which works fine, but over time the fit will get a bit looser. PETG would probably be perfect as it is more stable and flexible.

Pretty much any settings will work, but I like to do 1 wall with .655mm outer wall width to make the arms in one continuous path. I also used no infill so my transparent filament looked better and to keep the weight down, but honestly even stock settings would be fine. Brims are always a good idea, but I personally haven't needed them.

Should fit between a 7A and a 5B. For reference, the inner diameter of the arms is 13mm.

Enjoy!
