### Summary

Holds not one, but TWO pairs of drumsticks together

Due to the unprecedented success of my other drumstick keeper, I bring to you... **The Drumsticks Keeper: Two Pairs Edition!**

As before I got tired of using rubber bands to keep my sticks together, and also of having to hold more than one thing at a time.

I printed these in PLA which works fine, but over time the fit will get a bit looser. PETG would probably be perfect as it is more stable and flexible.

Pretty much any settings will work, but I like to do 1 wall with .655mm outer wall width to make the arms in one continuous path. I also used no infill so my transparent filament looked better and to keep the weight down, but honestly even stock settings would be fine. Brims are always a good idea, but I personally haven't needed them.

Should fit most drumsticks, but if you would like different sizes let me know!

Enjoy!
