Summary

I have had a good amount of spools fall off of the given holder, this will stop the spool from sliding out

Just use 0.2 layer heights, whatever material you want, relatively quick print. The default settings work well for it. The filament lock should slide over the edge of the spool holder and sit in place. Let me know if There are any adjustments needed. Spools coming off the holder is not an issue I would have thought of, but here we are.
