Couldn't find a model for this so i threw one together. This uses the factory mounting holes from the MKS ROBIN NANO V3. I'm unsure if the mounting holes differ on the SKR version of the printer. My Nano board burned out on me and i had the SKR handy so i threw it in. Funny enough, the printer is quieter now and runs cooler inside the electronics enclosure. You can still mount the driver fan appropriately with plenty of clearance for wiring.
