I bought a Logitech G920 second hand off Facebook marketplace and one of the clamp screws for the shifter were broken off so I couldn't tighten one of them properly. Furthermore the other side was missing a spring, so it got stuck down and I couldn't tighten that side either. I searched far and wide on all the model websites but couldn't find one that fit my needs. Hence I decided to whip out my calipers and design one myself. I made it longer to compensate for the lack of springs and also made it a bit more rigid. Works great and really glad I finally fixed it. I have included pictures of a stock one vs the one I designed.
