I bought a SNZB-03 for turning on the light in my office, and needed somewhere to mount it. And since i have a HSW system next to my office space, i tought why not just mount it there. So i looked for a mount, and to my surprise i didnt find any. So i decided to make one.

Prints supportless, and fits nicely, without being hard to take out for battery change for example.

I will do a better writeup on it later, but i wanted to at least share the model :)
