Remix of: <https://www.thingiverse.com/thing:6341148> and <https://www.thingiverse.com/thing:2596157>

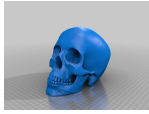

I have used a different skull that is simpler to print and much faster to print (half time for my settings). I used PLA-CF which came out great.

This print benefits from interface layers in PETG (or vice versa) but to keep things simple I first printed entirely in PLA-CF and removed tree supports manually which worked fine. All subsequent prints were completed with interface layers which worked wonderfully and made support removal a breeze.

Lastly, I used 1.26" magnets from [here](#) epoxied to the top of the stand and inside the helmet, mindful of polarity. Keeps the helmet super stable and secure.

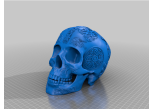

Multiple helmet models, all use the same extended height and the OG stand.
