This is a box for all cables from under the desk. It consists of two parts: the frame and the bottom layer. It is big enough to put all cables from three screens and dockingstations inside.

This container is open on two sides. I use the back side opening for all cables to go inside the box and the opening on the side for all outgoing cables.

This is an easy way of doing cable management because you can hide everything inside.

The bottom layer usually is as long as the frame. On my picture its just to short, because I was running out of filament and I didn't want to wait until I got my new filament so I used it as it was and it also works perfectly fine for me.
