Summary

Arduino controller to control a robotic arm from UR. But it can be used for whatever you like

It is an Arduino controller I made for a school project about controlling the movements of a robotic arm from UR (Universal Robots).

It has 4 buttons, 4 switches, a shield with 2 joysticks and a shield with an Ethernet port.

If you want to read more info about this project see my memory about it (it is in Spanish).

The controller of the photos is printed in SLS with a HP Multi Jet Fusion 5200 so its not cheap :) but with nice printing setting it should come out nice.
