Router template for a 120mm hole for mounting a standard sized fan.

Made this template since i had no other means of making the 120mm hole, worked perfectly. The plywood needed some sanding since the bit rips the layers apart, but most other wood panels would be much cleaner cuts.

Lined the screw holes up with the mounting holes for the fan i was using (Sunon brand) so make sure to line them up nicely before screwing the template on. You can just drill them out after and have no old screw holes left.

I made this for a commonly used combination of a copying ring 24mm + routing bit 18mm.
