Essentially just a screw. Super simple but looks better than keeping them in a bag, or a bin. This model fits Orangutang Skiffs but all you have to do to make one fit whatever wheels you have is:

**Step 1:** Start with base, make sure its slightly larger than the diameter of your wheels so the wheels sit at a little.

**Step 2:** Screw and tube should come off the center of each wall. Take the length of 4 wheels stacked and subtract a few mm so the screw doesn't bottom out. I'm sure there is a much better way of doing this but i do not know it and this allows you to just slightly pressure tighten it down on the wheels leaving no gaps.
