Summary

the original mount did interfere with klicky mount, because the chain is too far to the left.

Edit 17.08.24:

I have now added a new version with longer holes for better compatibility across manufacturing tolerances. Use “**Cable Chain Mount relocated with longer holes**” if you have issues with the screw holes.

The original mount did interfere with klicky mount, because the chain is too far to the left.

I fixed that here, so the chain is barely touching the klicky mount.

Use 65% infill for good stability and print in ABS is recommended if you are planning to use the enclosure to print high bed-temps.

Yes, I know the cable chain is not completely closed in my pictures, I still have to adjust things :)
